RE: 4th QT 2012 Report - Coal Hollow Mine  
Project ID: N14047-0002

Dear Mr. Black,

Please find enclosed the Summary of PM<sub>10</sub> Data Collected at the Coal Hollow Mine, Utah during the Fourth Quarter, 2012 prepared by Alton Coal Development, LLC.

Please do not hesitate to contact me if you have any questions. I can be reached at (435) 867-5331 or (435) 691-1551.

Sincerely,

B. Kirk Nicholes  
Environmental Specialist  
Alton Coal Development, LLC

## **1.0 INTRODUCTION**

This report summarizes measurements of Particulate Matter less than 10 microns nominal aerodynamic diameter ( $PM_{10}$ ) collected and processed by Alton Coal Development, LLC, (ACD) from the three monitoring stations located at the Coal Hollow Mine Facility in Alton, Utah. Monitoring for  $PM_{10}$  is a condition of the mines operating permit.

$PM_{10}$  monitoring at the site consists of three BGI PQ200  $PM_{10}$  monitors run by solar power. Figure 2 of this report shows the approximate locations of the monitoring locations. The BGI PQ200 monitors are EPA Reference Method monitors and are operated on the National Particulate 1-in-6 Monitoring Schedule. The data summarized herein covers the data collected during the fourth quarter of 2012.

## **2.0 SITE LOCATION**

The Coal Hollow Mine is located in Kane County, Utah, approximately three miles southeast of the town of Alton, Utah. Figure I on the following page gives an overview of the site location. Specifically the Coal Hollow Mine is located in Sections 19, 20, 29, and 30 of Township 39S, Range 5W; with an approximate facility location of:

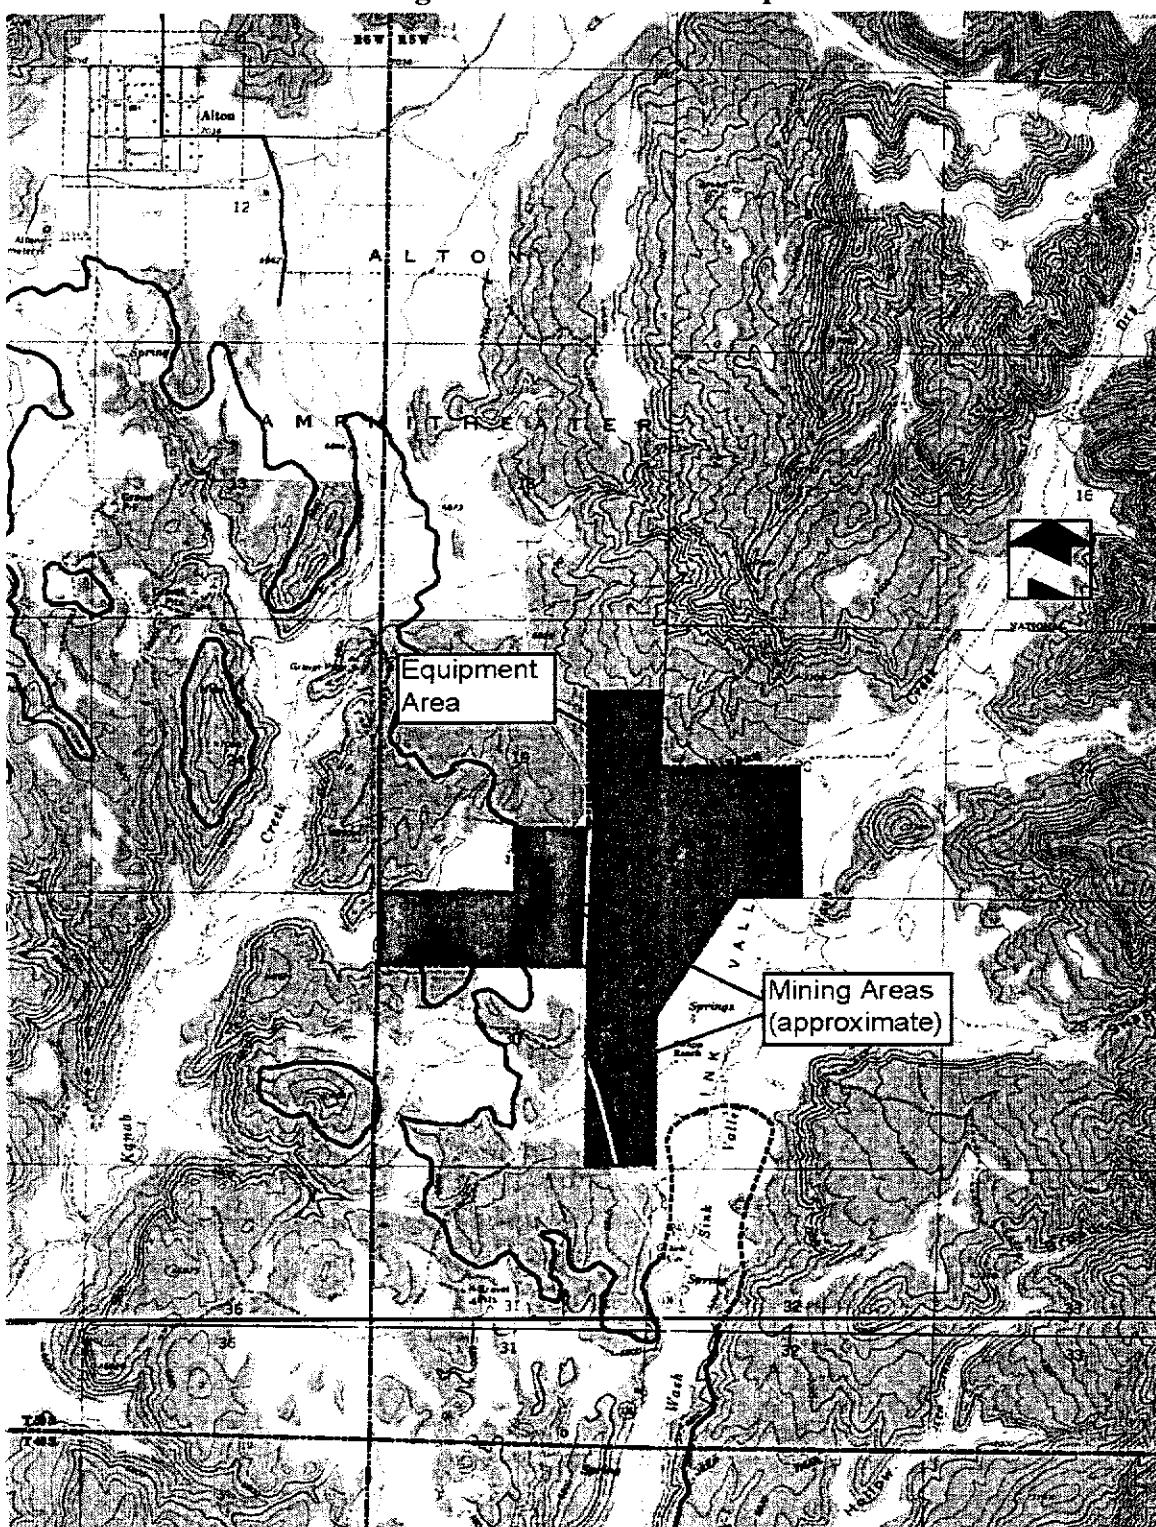

Northing: 41401699 meters

Easting: 371534 meters

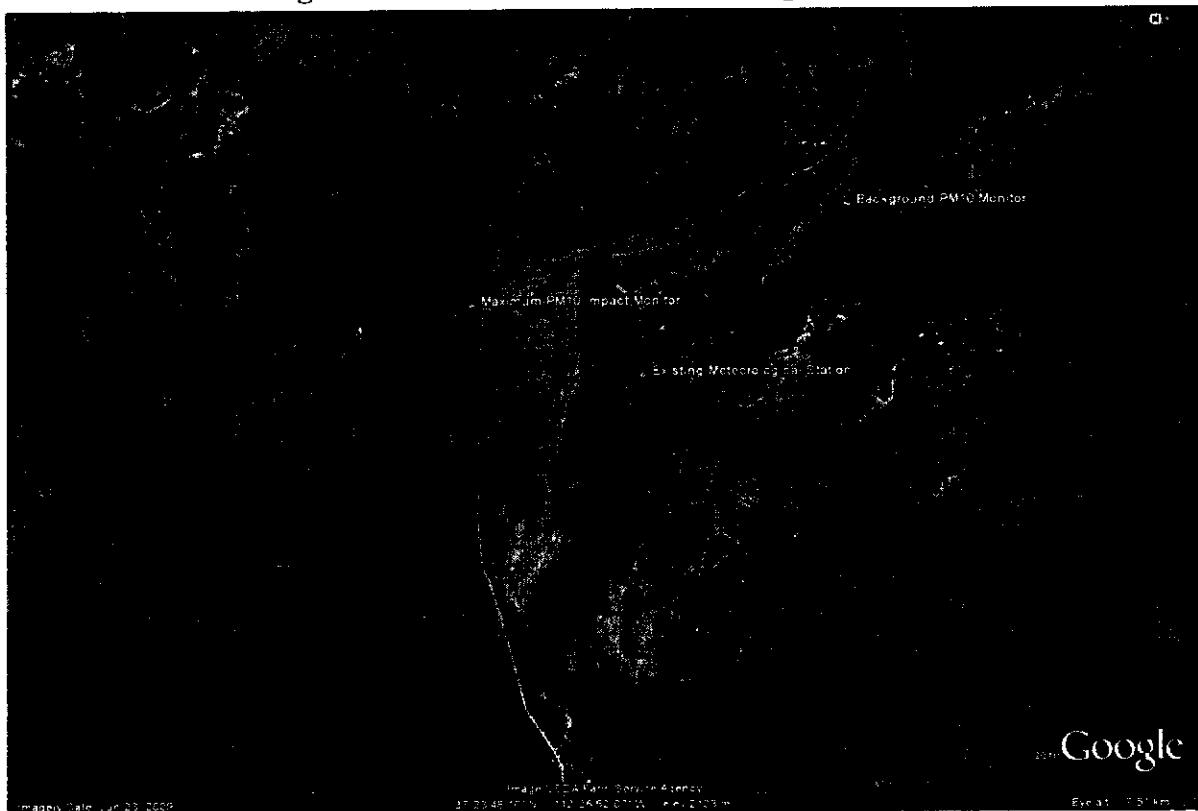

Universal Transverse Mercator (UTM) Datum NAD27, Zone 12

The two monitoring locations as depicted in Figure 2, are located in positions to collect both background and maximum  $PM_{10}$  concentrations. The background monitor has a manufacturer's serial #962, therefore this monitor will be referred as monitor 962A. The compliance monitor has a manufacturer's serial #963, therefore this monitor will be referred as monitor 963B. The co-located monitor has a manufacturer's serial #964, therefore this monitor will be referred as monitor 964C. The compliance monitor and the co-located monitor coordinates are  $37^{\circ} 24' 5.04''$  North Latitude,  $112^{\circ} 27' 20.91''$  West Longitude, WGS84 Datum. The background monitor coordinates are  $37^{\circ} 24' 21.96''$  North Latitude,  $112^{\circ} 25' 59.97''$  West Longitude, WGS84 Datum.

**Figure 1 - Site Location Map**

**Figure 2 - Satellite View of Monitoring Locations**

### **3.0 AIR QUALITY DATA SUMMARIES**

A listing of the measured PM<sub>10</sub> concentrations for the quarter are presented in Appendix B (individual data sheets found on the enclosed disk in the PDF version of Appendix B) and Field Data Sheets generated during the collection of each sample are presented in Appendix D. Measurements were collected during a 24-hour periods and represent the average PM<sub>10</sub> concentration during the midnight to midnight data collection cycle. As required by the operating permit, duplicate measurements were made with Sampler #963B (designated as a compliance monitor) and Sampler #964C (designated as a co-located sampler). The quarterly mean PM<sub>10</sub> concentration and the comparison of measured concentrations to standards are based on measurements from the primary Sampler #963B. If a measurement from Sampler #963B was missing or invalid, the measurement from the secondary Sampler #964C would be used.

The highest 24-hour mean PM<sub>10</sub> concentrations measured during the quarter from the two monitoring locations are summarized in Table I, Table II, and Table III. The three highest concentrations, # of valid samples, and the arithmetic mean concentrations from each of the sites are listed. All measured PM<sub>10</sub> concentrations were below the 24-hour National Ambient Air Quality Standard (NAAQS) of 150 µg/m<sup>3</sup>.

**Table I - Summary of Measured PM<sub>10</sub> Concentrations (µg/m<sup>3</sup>)**  
**Background Monitor - 962A**

RANK	DATE	PM <sub>10</sub> CONCENTRATION
Highest	10/06/2012	12.1
2 <sup>nd</sup> Highest	10/24/2012	7.5
Monthly Mean	10/1/12-10/31/12	5.8
Monthly Mean	11/1/12-11/30/12	4.1
Monthly Mean	12/1/12-12/31/12	3.0
Quarterly Mean	10/1/12-12/31/12 (15 valid samples)	4.3

**Table II - Summary of Measured PM<sub>10</sub> Concentrations (µg/m<sup>3</sup>)**  
**Compliance Monitor - 963B**

RANK	DATE	PM <sub>10</sub> CONCENTRATION
Highest	11/29/2012	66.3
2 <sup>nd</sup> Highest	10/24/2012	62.8
Monthly Mean	10/1/12-10/31/12	42.6
Monthly Mean	11/1/12-11/30/12	28.6
Monthly Mean	12/1/12-12/31/12	12.4
Quarterly Mean	10/1/12-12/31/12 (15 valid samples)	27.9

**Table III - Summary of Measured PM<sub>10</sub> Concentrations (µg/m<sup>3</sup>)**  
**Compliance Monitor – 964C**

RANK	DATE	PM <sub>10</sub> CONCENTRATION
Highest	11/29/2012	104.6
2 <sup>nd</sup> Highest	10/24/2012	66.5
Monthly Mean	10/1/12-10/31/12	43.9
Monthly Mean	11/1/12-11/30/12	38.2
Monthly Mean	12/1/12-12/31/12	15.2
Quarterly Mean	10/1/12-12/31/12 (12 valid samples)	32.9

**Table IV – Mean Quarterly and Monthly Wind Speed**

	4th Quarter 2012*	October*	November	December
Mean Wind Speed (m/s)	2.24	2.11	2.36	2.26

\*Information for October and the 4<sup>th</sup> Quarter are skewed due to sensor that was found to be worn out. It was immediately replaced upon discovery.

## **4.0 DATA RECOVERY AND QUALITY ASSURANCE**

### **4.1 Data Recovery**

#### Monitor 962A

Monitor 962A collected 15 of the 15 samples during the quarter. The percent recovery for this quarter is 100%.

#### Monitor 963B

Monitor 963B collected 15 of the 15 samples during the quarter. The percent recovery for this quarter is 100%.

### Monitor 964C

Monitor 964C collected 12 of the 15 samples during the quarter. The percent recovery for this quarter is 80.0%. The monitor for the date of November 5<sup>th</sup> overran the end time for a total of 35 h 19m of run time invalidating this sample. The monitor for the date of November 11<sup>th</sup> did not run due to a programing error, the month was not changed from October to November. The monitor error code for the date December 29<sup>th</sup> indicates that the monitor flow rate varied more than +/- 5 percent. A leak checks was performed on the 31<sup>st</sup> and adjustments made to the filter chamber lock.

The PM<sub>10</sub> data recoveries for the three monitoring stations are presented below:

**Table V - Summary of Data Recovery**

SAMPLER	POSSIBLE SAMPLES	VALID SAMPLES	PERCENT DATA RECOVERY
962A	15	15	100%
963B	15	15	100%
964C	15	12	80.0%

## **4.2 Quality Assurance**

Quality assurance procedures utilized to verify the integrity of the measured PM<sub>10</sub> data included the following:

1. Review of PM<sub>10</sub> precision measurements based upon duplicate, collocated measurements.
2. Independent quarterly audits of the PM<sub>10</sub> samplers.
3. Monthly zero and single point flow rate checks of the PM<sub>10</sub> samplers.

### **4.2.1 Precision of PM<sub>10</sub> Measurements**

The precision of the PM<sub>10</sub> measurements was determined from the duplicate samples collected from the collocated BGI PQ200 Monitors 963B and 964C. As recommended in 40 CFR, Part 58, Appendix A, Section 5.3.1, PM<sub>10</sub> precision checks are reported for instances when the concentrations for duplicate samples both exceed 3 µg/m<sup>3</sup>. Duplicate samples that

did not meet this condition were omitted for the purposes of the precision checks. Appendix C, of this report summarizes precision calculations between the compliance monitor and the co-located monitor. Monthly flow rate verification data is also summarized in Appendix C.

Precision calculations were developed based on 12 valid pairs of co-located monitoring data during the quarter. Single point precision based on *40 CFR, Part 58*, Appendix A Equation 10 ranged from -44.8% to 9.3% with the majority of precision values occurring in the 10% to -10% range. The aggregate coefficient of variability (CV) calculated in accordance with *40 CFR, Part 58*, Appendix A Equation 11 is 15.4%. This value is above the 10% goal for aggregate CV. The value for fourth quarter CV was significantly impacted by the two outlier values of -32.6% and -44.8%. Additionally, the CV value is typically reviewed on an annual basis for assessment of overall measurement error. Improvements have been made in tightening reducing the coefficient of variability, by improved maintenance/cleaning of the monitors. ACD will continue to investigate other causes that may have an effect on the correlation of precision calculations.

#### 4.2.2 Audit Results

The accuracy of the PM<sub>10</sub> sampler flows was verified by a performance audit conducted by Air Resource Specialist on October 16, 2012. A copy of the audit report is presented in Appendix E and is summarized in Table VI. The audit results indicate that the three samplers were operating properly.

**Table VI - Audit Summary**

SAMPLER	AUDIT % DIFFERENCE	LIMIT*	DESIGN % DIFFERENCE	LIMIT*
962A	-3.4	±4%	-3.2	± 5%
963B	-1.3	±4%	-0.2	± 5%
964C	-3.8	±4%	-0.0	± 5%

\*Values between ± 7% and ± 10% require recalibration but no data are invalidated.

#### 4.2.3 Zero and Single Point Flow Rate Checks

Zero and single-point flow rate verifications are performed by a site technician on a monthly basis. The data was then input into a statistical calculator to calculate percent difference and bias between each of the monitors and the monthly single point flow rate measured by a NIST

traceable calibration orifice. The calculator used is called the “Data Assessment Statistical Calculator” DASC Tool. DASC was developed for the data user community and can be found in the Precision and Accuracy Reporting System within the Quality Assurance section of EPA’s Ambient Monitoring Technology Information System. This data is presented in Appendix C of this report.

## 1.0 AUDIT SUMMARY

Alton Coal Development is operating three (3) Federal Reference Method (FRM) PM<sub>10</sub> particulate samplers and a meteorological station at the Coal Hollow Mine near Alton, Utah. Air Resources Specialists, Inc. (ARS) conducted a performance audit of the monitoring systems on October 16, 2012. Guidance from the following EPA documents was used to establish the audit procedures:

- 40 CFR 58, Appendix A. *Quality Assurance Requirements for SLAMS, SPMs, and PSD Air Monitoring*
- EPA *Quality Assurance Handbook for Air Pollution Measurement Systems*:
  - *Volume I. A Field Guide to Environmental Quality Assurance*
  - *Volume II. Ambient Air Quality Monitoring Program*

At the time of the audit, all three (3) FRM particulate samplers and all of the meteorological systems were operating within EPA and project accuracy goals, with the exception of the wind direction linearity. Air quality audit results are summarized by parameter in Table 1-1.

Table 1-1  
Summary of Air Quality Audit Results

Parameter	Manufacturer/Instrument	Within Accuracy Goal
<b>Particulate Sampler</b>		
PM <sub>10</sub>	BGI PQ200 – Background	Yes
PM <sub>10</sub>	BGI PQ200 – East Collocated	Yes
PM <sub>10</sub>	BGI PQ200 – West Collocated	Yes
<b>Meteorological Equipment</b>		
Wind Speed/Direction	Met One 034B	No
Temperature	Campbell Scientific CS	Yes
Precipitation	Hydrological Services TB4	Yes

Details of the audit are presented in the following sections:

Section 2.0	Audit Methods
Section 3.0	Audit Equipment
Section 4.0	Audit Results
Appendix A	Audit Data Sheets
Appendix B	Audit Standards Certifications

Any questions related to this audit or audit report should be addressed to:

## 2.0 AUDIT METHODS

Audit procedures, audit challenge ranges, and acceptance criteria are described below. These ranges and limits exceed or conform to the Alton Coal Quality Assurance Project Plan prepared by JBR. Audit results were verbally communicated to the Alton Coal Development Environmental Manager prior to departure from the site. Audit data forms are provided in Appendix A.

### 2.1 PARTICULATE SAMPLERS

Three (3) volumetric flow FRM PM<sub>10</sub> particulate samplers were audited. ARS audited the sampler with a BIOS Definer 220 instrument which measures flow, ambient temperature, and barometric pressure. After conducting the flow audit, a system leak check was performed. During a leak check, the Model PQ200 FRM sampler will not measure flow rate; therefore, a change in vacuum over a two-minute period is used to identify a leak. The instrument manufacturer states in the operation manual, a measurement of  $\geq 5$  cm of water in a two-minute period is considered a leak. This value will be used to identify if a leak is present. The observed volumetric operational flow and design flow of the sampler were compared to the audit flows measured by the ARS BIOS. Differences between the operational sampler flow and audit flow that are greater than  $\pm 4\%$  are considered out of tolerance. Differences between the designated design flow and the audit flow greater than  $\pm 5\%$  are considered out of tolerance as indicated in 40 CFR Part 58 Appendix A. In addition to the flow audits, the FRM's observed ambient temperature and barometric pressure sensors were also audited by comparison to the BIOS values. A temperature difference greater than  $\pm 2.0^{\circ}\text{C}$  and a barometric pressure difference greater than  $\pm 10\text{mm Hg}$  are considered out of tolerance. Audit methods and acceptable criteria for the particulate samplers are summarized in Table 2-1.

Table 2-1

#### FRM PM<sub>10</sub> Particulate Samplers Audit Methods and Acceptance Criteria

Parameter	Audit Method	Acceptance Criteria
Leak Check	Change in vacuum of closed inlet in 2 minutes	$< 5 \text{ cm H}_2\text{O in 2 min}^*$
Actual Volumetric Sampler Flow	DeltaCal audit flow to actual sampler flow (volumetric)	$\leq \pm 4\%$
Designated Design Flow	Designated design flow to audit flow (volumetric)	$\leq \pm 5\%$
Ambient Temperature ( $^{\circ}\text{C}$ )	Audit temperature to sampler temperature	$\leq \pm 2^{\circ}\text{C}$
Barometric Pressure (mm Hg)	Audit barometric pressure to sampler pressure	$\leq \pm 10\text{mm Hg}$

\*As suggested by manufacturer.

### 2.2 METEOROLOGICAL PARAMETERS

Meteorological measurement systems were audited in accordance with the EPA's *Quality Assurance Handbook for Air Pollution Measurement Systems: Volume IV – Meteorological Measurements*, (March 2008). Accuracy goals for the meteorological parameters were obtained

from the EPA's *On-Site Meteorological Program Guidance for Regulatory Modeling Applications*. ARS used National Institute of Standards and Technologies (NIST)-traceable test equipment for all meteorological parameters. Audit ranges and acceptable criteria for each parameter are summarized in Table 2-2. Meteorological audit procedures follow.

Table 2-2

**Meteorological Sensors  
Audit Ranges and Acceptance Criteria**

Sensor	Parameter	Audit Challenge Ranges	Acceptance Criteria
Wind Speed (Horizontal)	• Speed Accuracy	Three (3) RPM Values	0.447 mph + 5% of Observed
	• Starting Threshold	Starting Torque	$\leq 0.2 \text{ gm-cm}$ (horizontal) $\leq 2.0 \text{ gm-cm}$ (vertical)
Wind Direction	• Orientation Accuracy	To and From Two (2) Landmarks	$\pm 5^\circ$ in Any Direction
	• Response Threshold	Starting Torque	$\leq 7.0 \text{ gm-cm}$
Temperature and	• Accuracy and Linearity	Three (3) Temperature Baths: 0°C, Near Ambient, and Near Full-Scale	Temperature $\pm 0.5^\circ\text{C}$
Precipitation	• Accuracy	Compared to Three (3) Known Amounts of Introduced Water	$\pm 10\%$ of Observed
	• Tip Response	Manual Tips	One (1) contact closure per tip

Wind Speed - Dynamic tests of the horizontal wind speed sensors were performed using an R.M. Young model 18810 pulsed motor wind speed calibrator. Each sensor was tested at zero plus three (3) shaft revolution speeds (300, 600, and 900 rpm). The equivalent wind speed was calculated corresponding to the manufacturer's specified values for shaft rpm versus wind velocity and compared to readings obtained from the on-site datalogger and backup strip chart recorder.

Wind Direction - Wind direction sensor audits included the verification of sensor orientation, linearity, and bearing integrity. ARS established two (2) reference landmarks separated by approximately 90°. Accuracy of the landmarks was verified by use of a Brunton compass mounted on a tripod and knowledge of the site location in terms of latitude and longitude. A computer program was used to establish the declination of the site. Once the compass was oriented based on the magnetic declination, wind direction references were established. The sensor orientation was checked by aligning the direction vane to and from each landmark reference.

Potentiometer linearity was tested by verifying the accuracy of the measured wind direction towards and away from the two (2) designated landmarks. If the checks are within  $\pm 5$  degree accuracy, the linearity is also valid. The linearity checked failed one of the eight points tested.

Temperature- The temperature sensor was audited by immersion in three (3) temperature baths with NIST-traceable thermometers. The temperature tests were performed at 0°C, ambient (approximately 20°C), and as near to full-scale as possible. Bath temperature readings obtained with the NIST-traceable thermometer were compared to the on-site datalogger output.

Precipitation - The tipping bucket precipitation gauge was audited by using a volumetric precipitation gauge calibrator and transferring a known amount of water through the gauge orifice at a rate equivalent to 2.0 inches/hour of precipitation. The tip response of the on-site datalogger was verified, and the total datalogger values were compared to the actual introduced volumes.

### **3.0 AUDIT EQUIPMENT**

All audit equipment and reference standards were in current calibration and traceable to the NIST or other authoritative references. Table 3-1 lists the specific audit equipment used and recertification dates. Copies of standards certifications for the equipment used in the audit are provided in Appendix C.

## 4.0 AUDIT RESULTS

Detailed Alton Coal Development monitoring system audit results for the particulate samplers are shown in Tables 4-1 through 4-3; meteorological results are in Table 4-4. Audit findings and recommendations are discussed below.

### 4.1 AUDIT FINDINGS

#### Performance Audit Results

- All three (3) PM<sub>10</sub> samplers were operating within project accuracy goals.
- The meteorological station was operating within project accuracy goals, with the exception of wind direction linearity.

#### System Audit Results

- No system problems.

**Calibration Notes**

Bios is an ISO 17025-accredited metrology laboratory. Each Bios primary gas flow standard is dynamically verified by comparing it to one of our laboratory standards, which is a Proven DryCal® Technology volumetric piston prover of much higher accuracy ( $\pm 0.25\%$  or less) but of similar operating principles. For this purpose, a flow generator of  $\pm 0.10\%$  or less stability is used. Our laboratory standards are qualified by direct measurement of their dimensions (diameter, length and time) using NIST-traceable precision gauges and instruments, such as depth micrometers and laser micrometers. Calibration Certificates for these gauges and instruments are available upon request. Rigorous analyses of our laboratory standards' uncertainties have been performed, in accordance with The Guide to the Expression of Uncertainty in Measurement (the GUM), assuring their traceable accuracy.

Flow readings in sccm performed at STP of 21.1°C and 760 mmHg.

Technician Notes: \_\_\_\_\_

ANDREW BORICH

BRIAN GOLD

Unless Otherwise Noted, Uncertainty Estimated at  $\geq 4$  to 1. Uncertainties have been estimated at a 95 percent confidence level ( $k=2$ ). Services rendered comply with ISO 17025:2005, ISO 9001:2008, ANSI/NCSL Z540-3, MPC Quality Manual, MPC CSD, and with customer purchase order instructions.

Calibration cycles and resulting due dates were submitted/approved by the customer. Any number of factors may cause an instrument to drift out of tolerance before the next scheduled calibration. Recalibration cycles should be based on frequency of use, environmental conditions and customer's established systematic accuracy. The information on this report, pertains only to the instrument identified.

All standards are traceable to the National Institute of Standards and Technology (NIST). Services rendered include proper manufacturer's service instructions and are warranted for no less than thirty (30) days. This report may not be reproduced in part or in whole without the prior written approval of the issuing MPC lab.

Unless Otherwise Noted, Uncertainty Estimated at  $\geq 4$  to 1. Uncertainties have been estimated at a 95 percent confidence level ( $k=2$ ). Services rendered comply with ISO 17025:2005, ISO 9001:2008, ANSI/NCSL Z540-3, MPC Quality Manual, MPC CSO, and with customer purchase order instructions.

Calibration cycles and resulting due dates were submitted/approved by the customer. Any number of factors may cause an instrument to drift out of tolerance before the next scheduled calibration. Recalibration cycles should be based on frequency of use, environmental conditions and customer's established systematic accuracy. The information on this report, pertains only to the instrument identified.

All standards are traceable to the National Institute of Standards and Technology (NIST). Services rendered include proper manufacturer's service instructions and are warranted for no less than thirty (30) days. This report may not be reproduced in part or in whole without the prior written approval of the issuing MPC lab.

QC Approval:

A handwritten signature in black ink, appearing to read "Brian Gold".
